Research Tools Impact

FERRET

- Performs automated testing of DNS nameserver implementations by using symbolic execution of the DNS formal model
- Scales better than symbolic testing and finds deeper (RFC violation) bugs than fuzz testing
- Found **30** bugs across 8 different open-sourced DNS implementations, including popular implementations such as Bind, PowerDNS, Knot, and Nsd, of which **20** are fixed
- Found a critical vulnerability where an attacker with little effort could **crash** Bind name-servers and resolvers remotely (High-severity rated [CVE-2021-25215](#))
- Found **4** bugs in [Amazon Route 53 DNS](#) implementation (tests now part of CI/CD pipeline)

GROOT

- Verifies efficiently that a property of interest holds for all possible DNS queries by reducing the extremely large space of possible queries to a smaller set of *query equivalence classes*
- Found multiple issues of delegation inconsistencies, cyclic zone dependencies, and rewrite blackholing in minutes in the Microsoft zone files with over 500k records
- Revealed **109** new bugs in 10 seconds in a large campus network with over a hundred thousand records
- Found around **160k** issues of blackholing in 3 minutes, which initiated a cleanup of the zone files of a large CDN with over 3.5 million records

SELFSTARTER

- Automatically finds configuration errors without a specification via a form of outlier detection on inferred templates
- Found **33** route policies with previously unknown bugs in the [Microsoft wide area network](#)
- Inferred templates provide *actionable* feedback to the operators to remediate the errors
